

The Spend Plane for the Agent Economy

Governance, compliance and cost control for AI agents and MCP server usage in the enterprise.

Every integration wave needs a control plane. SOAP had app servers. REST had API gateways. gRPC and GraphQL had the service mesh. The technology underneath changes — deploy services, route traffic, govern who can call what, audit everything — but the operational shape never does. MCP is the newest wave, and its control plane doesn't exist yet.

And this wave moves money. Agents now transact through MCP servers that bill on usage, and tens of thousands of them turn spend unpredictable fast. Developers stand up shadow servers with no audit trail or lifecycle, agents call enterprise systems with no per-tool access control, and no tool today gives a CFO a budget lever. Governance and cost are converging into one missing layer — orchestration is that layer.

THE SOLUTION

Governance gets us in the door. Cost control makes us indispensable.

Magertron™ runs in your own Kubernetes cluster, in the transaction path — enforcing policy and capping cost.

Govern — design-time + run-time policy, default-deny.

Cap the spend — per-server, per-tool, real-time.

Meter & charge back — metered, hard per-user limits.

Detect & block — rogue servers, in or out of perimeter.

Attribute the spend — per user, per dept, point-in-time.

The CFO's guardrail — not a kill switch.

Live AI spend, committed vs. pay-as-you-go, and per-vendor success.

PROOF

Chargeback by team and agent.

Built and shipping — not a slideware promise.

- ✓ Per-tool RBAC (default-deny), mTLS, SSO/SCIM, OCSF audit.
- ✓ BYOK across five auth protocols: DCR (RFC 7591), OAuth2 Client Credentials, OAuth2 Delegated, mTLS, Bearer.
- ✓ Validated with Okta, Splunk, Datadog, OIDC, SCIM.
- ✓ SOC 2 Type II in progress.
